

# Innovative Cell culture and purification approaches applied to cost-effective manufacturing of viral vaccines

DCVMN Seminar

October 12th, 2017 -- Gosselies, Belgium

# Vaccines are the most efficient tools to **prevent infectious diseases**

Immunization currently averts an estimated **2 to 3 million deaths every year (of DTP and Measles).**

An additional **1.5 million deaths could be avoided**, however, if global vaccination coverage improves.

An estimated **19.4 million infants** worldwide are still missing out on basic vaccines.

In addition :

**Insufficient supply and late availability (i.e.)**

Pprevnar in 2011, USA

BCG in 2015, France

Meningitis C in 2015, Africa

DPTp in 2015, India

**Crisis examples**

Zika Virus spread

Ebola epidemic

**Increased capacity of production and cheaper vaccines** are urgently needed

The global vaccine market will reach **48Bn\$ in 2021**, and 90% in the developed countries.

**Emerging countries** must become able to **manufacture their own vaccines**

# Vaccine Manufacturing Today... **Limited Innovation**

- > Over 80% of viral vaccines are still manufactured by the **scaling out** of lab-scale systems
- > **Barrier: Very high CAPEX**
- > **Risk:** High number of **aseptic manual operations**
- > **Production capacity** ↓↓, **cost** ↑

- > Some vaccines are manufactured in bioreactors – **scaling up**
- > **Barrier: Extremely high CAPEX**
- > **Reduced risk:** Limited aseptic manual operations
- > **Production capacity** ↑↑, **cost** ↑↑

# Problems with the current technologies... Barriers to entry

- Current manufacturing methods require large factories and high CAPEX (>100M\$)
- Manufacturing are complex processes, which needs large, well-trained workforce
- Production is still based on \*Batches\* processes (separated steps of manufacturing)
- The production uses low-density manufacturing technology, leading to high COGS.
- Regulatory and quality-control processes are costly and complicated.

**=> Those barriers are preventing small players and emerging countries to enter the market**

## **INNOVATION in MANUFACTURING**

**Densification** and **Chaining** of operations

Disruptive innovation in the manufacturing technology could **reduce the footprint of factories, simplify and automate the Process,** which will **simplify the QC** and be **run in a continuous fashion.**

# Univercells' Vaccine Manufacturing Proposal

## Concept:

Single-Use, very **high-density bioreactor** (reduction of size)

- Cells grow in fibers in bioreactor, medium perfused through
- Bioreactor scalable from 0.5M2 to 2000M2
- Cell density up to 250M cells/mL achieved in small footprint

**Inline** filtration, **adjustment of perfusate** (pH, conductivity) and **purification** – No intermediate storage tank

Continuous process allow to **use small purification columns up to 100 cycles** during a single run

CHAINING of operations allows simple **micro-facility**, with very small footprint

Intensification  
of unit steps

Integration into a  
continuous process

**SINGLE-USE "CLASSICAL" PROCESS**

**UNIVERCELLS' NEW CONCEPT**

# Evolution of the vaccine manufacturing using Bioreactors

Conventional reactor  
+ Microcarriers

- > Based on Microcarriers
- > **1 to 10M cells/ml**
- > Batch process, not integrated with DSP
- > High footprint

iCELLis bioreactor

- > Microcarriers replaced by microfibers
- > High cell density - **up to 100M cells/ml**  
(20-fold increase compared to microcarriers)
- > Can be integrated with Purification (DSP)
- > Reduced CAPEX & OPEX, small footprint
- > sIPV in 500M<sup>2</sup> (65L) iCellis = 500,000 doses (equivalent to 750L Conventional)

Univercells Microfacility

- > Simpler/lower cost reliable design
- > High cell density - **up to 250M cells/ml**
- > Continuous process USP => DSP
- > Housed into isolators
- > Reduced CAPEX & OPEX, small footprint
- > sIPV in 500M<sup>2</sup> (25L) = Up to 2M doses

UNVC team has experience with **bio-manufacturing technologies**, following a first success with **Artelis**, subsequently sold to ATMI & Pall

Innovation **complete** solution

OmniVax

Development of an  
Integrated Platform for the  
Low Cost Manufacture of  
Vaccines for Global Health

BILL & MELINDA  
GATES *foundation*

# The Platform goals

## Target \$0.15 per dose vaccine drug product cost

- > Increased process productivity, yield and robustness
- > Reduced process-related operating costs (materials, labour, utilities etc)
- > Simplified, smaller facility with much reduced capital costs

## Expansion of market supply - 40M doses / year with 'micro-facilities'

- > High productivity ensures global supply from multiple small facilities

## Low hurdle for implementation

- > Low CAPEX
- > Suitable for new facility or retrofit of existing facility
- > Single-use templated platform reduces overall risk
- > High safety and containment

# Representatives of the chosen consortium (out of 155 candidates)

- > Consortium integrator, coordinator and responsible party
- > Integrated continuous manufacturing technologies
- > High cell density bioreactor

- > High capacity / high flow purification membranes
- > High efficiency affinity ligands

- > Viral vaccine process development & manufacturing
- > Cell line development

# Addressing the Challenge

- 1

**Optimized cell line and production medium**

Target: >2-fold increase in virus productivity

---

- 2

**High Cell Density Bioreactor** (Target: >20-fold increase in cell density and virus productivity) and

**Affinity Purification Membranes** (Target: 2-fold increase in recovery, single step purification)

---

- 3

**Integrated continuous process** Linked process in modular isolators – small footprint, low cost (OPEX and CAPEX), high **containment** manufacturing environment

## 3 pillars

to establish an integrated manufacturing platform, applicable to multiple vaccines

# Path to sIPV at \$0.15/dose – 40M doses/year from a lab-scale micro-facility

## Driving down the cost

...to 15¢  
per dose

- > sIPV process and facility ready for manufacture in 2 yr timeframe
- > **Chained process** with intensification technologies for fewer, smaller unit ops enables isolators to miniaturize the facility
- > Industrial production at lab scale with **isolator-based micro-facility** for
  - > Simplified infrastructure and dramatic decrease of CAPEX, the biggest factor driving reduction in cost/dose
  - > Simplified operations for a robust platform that can be replicated and/or quickly deployed for in-region manufacturing
- > 40M vaccine doses per year from **\$10M investment in the facility** that delivers sIPV product at as low as \$0.15/dose

## Pillar 1: Optimized cell line & production medium

Sub-clone of  
WHO 10-87 cell line

Increased virus  
production capabilities

Selected viral sensitizers  
and (lipid-based) viral yield  
enhancers

Increased virus yields

Selected low serum or  
serum-free growth media

High cell densities and low cost

## Pillar 2 (1): high cell density, small footprint, single-use bioreactor

Conventional reactor  
+ Microcarriers

iCELLis

- > Microcarriers replaced by microfibers
- > High cell density - up to 100M cells/ml (20-fold increase compared to microcarriers)
- > Reduced CAPEX & OPEX, small footprint
- > sIPV in 500M<sup>2</sup> (65L) iCellis = 500,000 doses (equivalent to 750L STR)

Univercells Bioreactor

- > **Simpler/lower cost reliable design**
- > High cell density - up to 200M cells/ml
- > **"Integratable" into isolators**
- > (40-fold increase compared to microcarriers)
- > Reduced CAPEX & OPEX, small footprint
- > sIPV in 500M<sup>2</sup> (25L) = 500,000 doses

## Pillar 2 (1): high cell density, small footprint, single-use bioreactor

Evaluation of microfiber technology – structured fixed bed with multiple embodiments

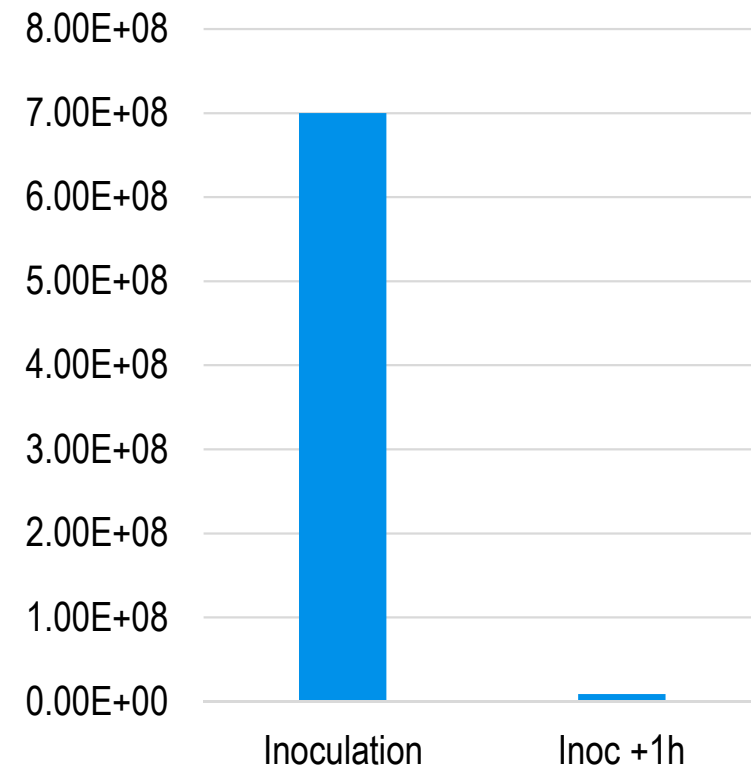

### Benefits of a structured bed

- > Homogeneity – scale up virtually non limited
- > Fast cells entrapment/attachment
- > Easier to fabricate – cost effective
- > Compatible with multiple bioreactors

### Cell Entrapment Kinetics

# Pillar 2 (1): high cell density, small footprint, single-use bioreactor

## Bioreactors evaluation – structured fixed bed with multiple embodiments

- > **Cell culture and virus production in Tested bioreactors:**
  - Use of parental cell line
  - Target density at infection: 30-40M/ml
  - Reproducible growth in DMEM-Serum
- > **3x 2,5m<sup>2</sup> bioreactors have undergone cell culture trials**
  - Multiple runs show similar cell growth compared to the reference run performed at Univercells and on iCellis bioreactor system
- > **25m<sup>2</sup> to be tested in November**

# Pillar 2 (1): high cell density, small footprint, single-use bioreactor

## Structured fixed bed bioreactors with multiple embodiments

sIPV3

- > **Cell culture and virus production** in tested bioreactors:
  - Use of parental cell line first
- > **Initial optimization** leads to:
  - Doubling of D-antigen output per run
  - Concentrated DU/mL thanks to medium feeding

Improvements

- > 90 DU/mL (n=26) vs 4560 DU/mL<sub>FBed</sub> (n=1)
- > **~40x** in BioR volumetric productivity
- > With current small scale yields and parental cell line, **Univercells process would yield:**
  - @500m<sup>2</sup> / 37L FB and 2x250L medium in perfusion, ~650DU/mL in 250L
  - ~4.2M doses/run in crude harvest

Production system	D-Ag/mL of culture media	D-Ag/cm <sup>2</sup>	D-Ag/cell at infection	D-Ag/mL of fixed-bed
Spin tube	89 ± 31 (n=49)	TBD	TBD	NA
Fixed-bed bioreactor (Standard process)	118 ± 18 (n=2)	18.8	7.2 x 10 <sup>-5</sup>	2664
				↓ x 1,7
Fixed-Bed bioreactor (Optimized process)	646 (n=1)	32.3	1.7 x 10 <sup>-4</sup>	4560

Day 0

Inoculation at 0,7x10<sup>6</sup>cells/ml FB  
Growth in with 0.17 ml/cm<sup>2</sup> media with 5% serum

Harvest Day 6 dpi

Day 5

Infection at ~ 30-35x10<sup>6</sup>cells/ml FB  
**Infection with (0.05 ml/cm<sup>2</sup> D1) + (0,05 ml/cm<sup>2</sup> D2-5) Serum-free media**

## Pillar 2 (1): high cell density, small footprint, single-use bioreactor

Univercells Bioreactor – structured fixed bed with multiple embodiments

sIPV2

- > sIPV3 improved process used for sIPV2
  - Infection medium reduction (from 0.17 mL/cm<sup>2</sup> to 0.1 mL/cm<sup>2</sup>) and feeding optimization
  - Cell growth performed in serum-free
  - sIPV2 production is feasible in UNC Bioreactors

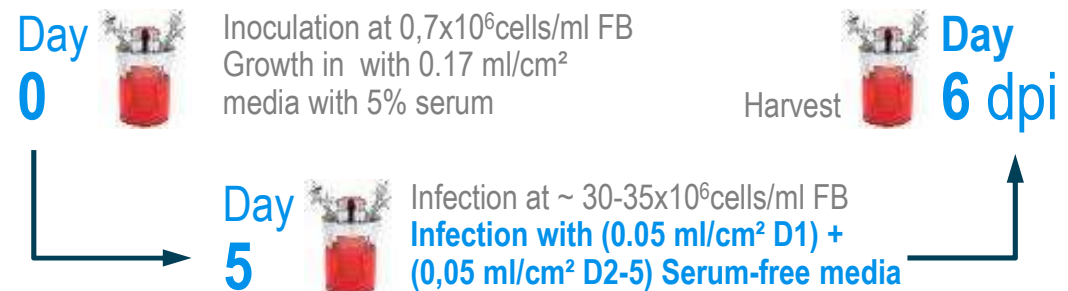

Improvements

9.1 DU/mL (n=50) vs 364 DU/mL<sub>Fbed</sub> (n=1)  
**~40x** in BioR volumetric productivity

With current small scale yields and parental cell line, **Univercells process would yield:**

- > @500m<sup>2</sup> / 37L FB and 2x250L medium in perfusion, 52DU/mL in 250L
- > ~0.7M doses/run in crude harvest

Production system	D-Ag/mL of culture media	D-Ag/cm <sup>2</sup>	D-Ag/cell at infection	D-Ag/mL of fixed-bed
Spin tube	9.1 ± 5 (n=50)	0.67	4.48x10 <sup>-5</sup>	NA
Fixed-Bed bioreactor (Optimized process)	52 ± 2 (n=1)	2.6	1.4 x10 <sup>-5</sup>	364

## Pillar 2 (2): High capacity purification membranes

- > Affinity membranes drive >3-fold productivity over traditional resins
- > Membranes introduced in 2013, accepted for GMP manufacturing

## Slide 19

---

**JC5**

Thought we had a better slide than this one that shows the same evolution for chromatography as for reactors. I'll look while flying to Mumbai  
John Chickosky; 27 Mar 2017

# Update Project progress – Technical Goal 1

## WP2: Development of DSP

- > DSP development outline and progress
  - Screening performed for S2 and S3 at small scale
- > Promising results with PV3 – HD-Sb delivers expected performance
  - **High binding capacity** (>50 000DU/mL Mb)
  - **Good HCP clearance** (<0.1µg HCP/DU) – Meets WHO specs
  - **High yield**: >90% (Target for the overall DSP >70%)
- > Reduction of clarification footprint and cost is underway.  
Footprint estimated to be less than 50% of the current depth filter-based train (data analysis ongoing)
- > Similar results are expected with PV2 (data analysis ongoing)

Recovery	94%	ug HCP/DU	<0.04
Mass Balance	95%	DNA LRV	Pending
HCP LRV	1.6	ng DNA/DU	Pending

# Pillar 3: Platform enabled by innovative technologies

## Streamlined, simplified & miniaturized operations enable cost savings

The **intensification** technologies, **chained** into a continuous process, allow their integration into highly flexible, low footprint, isolated micro-facilities

### Micro-Facility Isolator Units

### Key take-aways

- > Low cost sIPV vaccine (as low as 15 cents per dose) seems achievable
- > Platform delivers commercial manufacturing at lab scale - new paradigm in vaccine manufacturing
- > Platform applicability and flexible for broad range of vaccines

### Core innovations

- > **Chained process** (continuous operations) enabled by right-sized tools, fewer steps to pure product
- > **Fixed-Bed bioreactors** operating in perfusion mode enable optimized productivity in the smallest footprint
- > **Inline, single-pass high capacity HD-Membranes** – mixed-mode for sIPV, **affinity for other vaccines** – enable single-step capture and purification of targets and maximum productivity

# Pillar 3: Platform enabled by innovative technologies

## Isolator Device Development: Full Scale Mockup

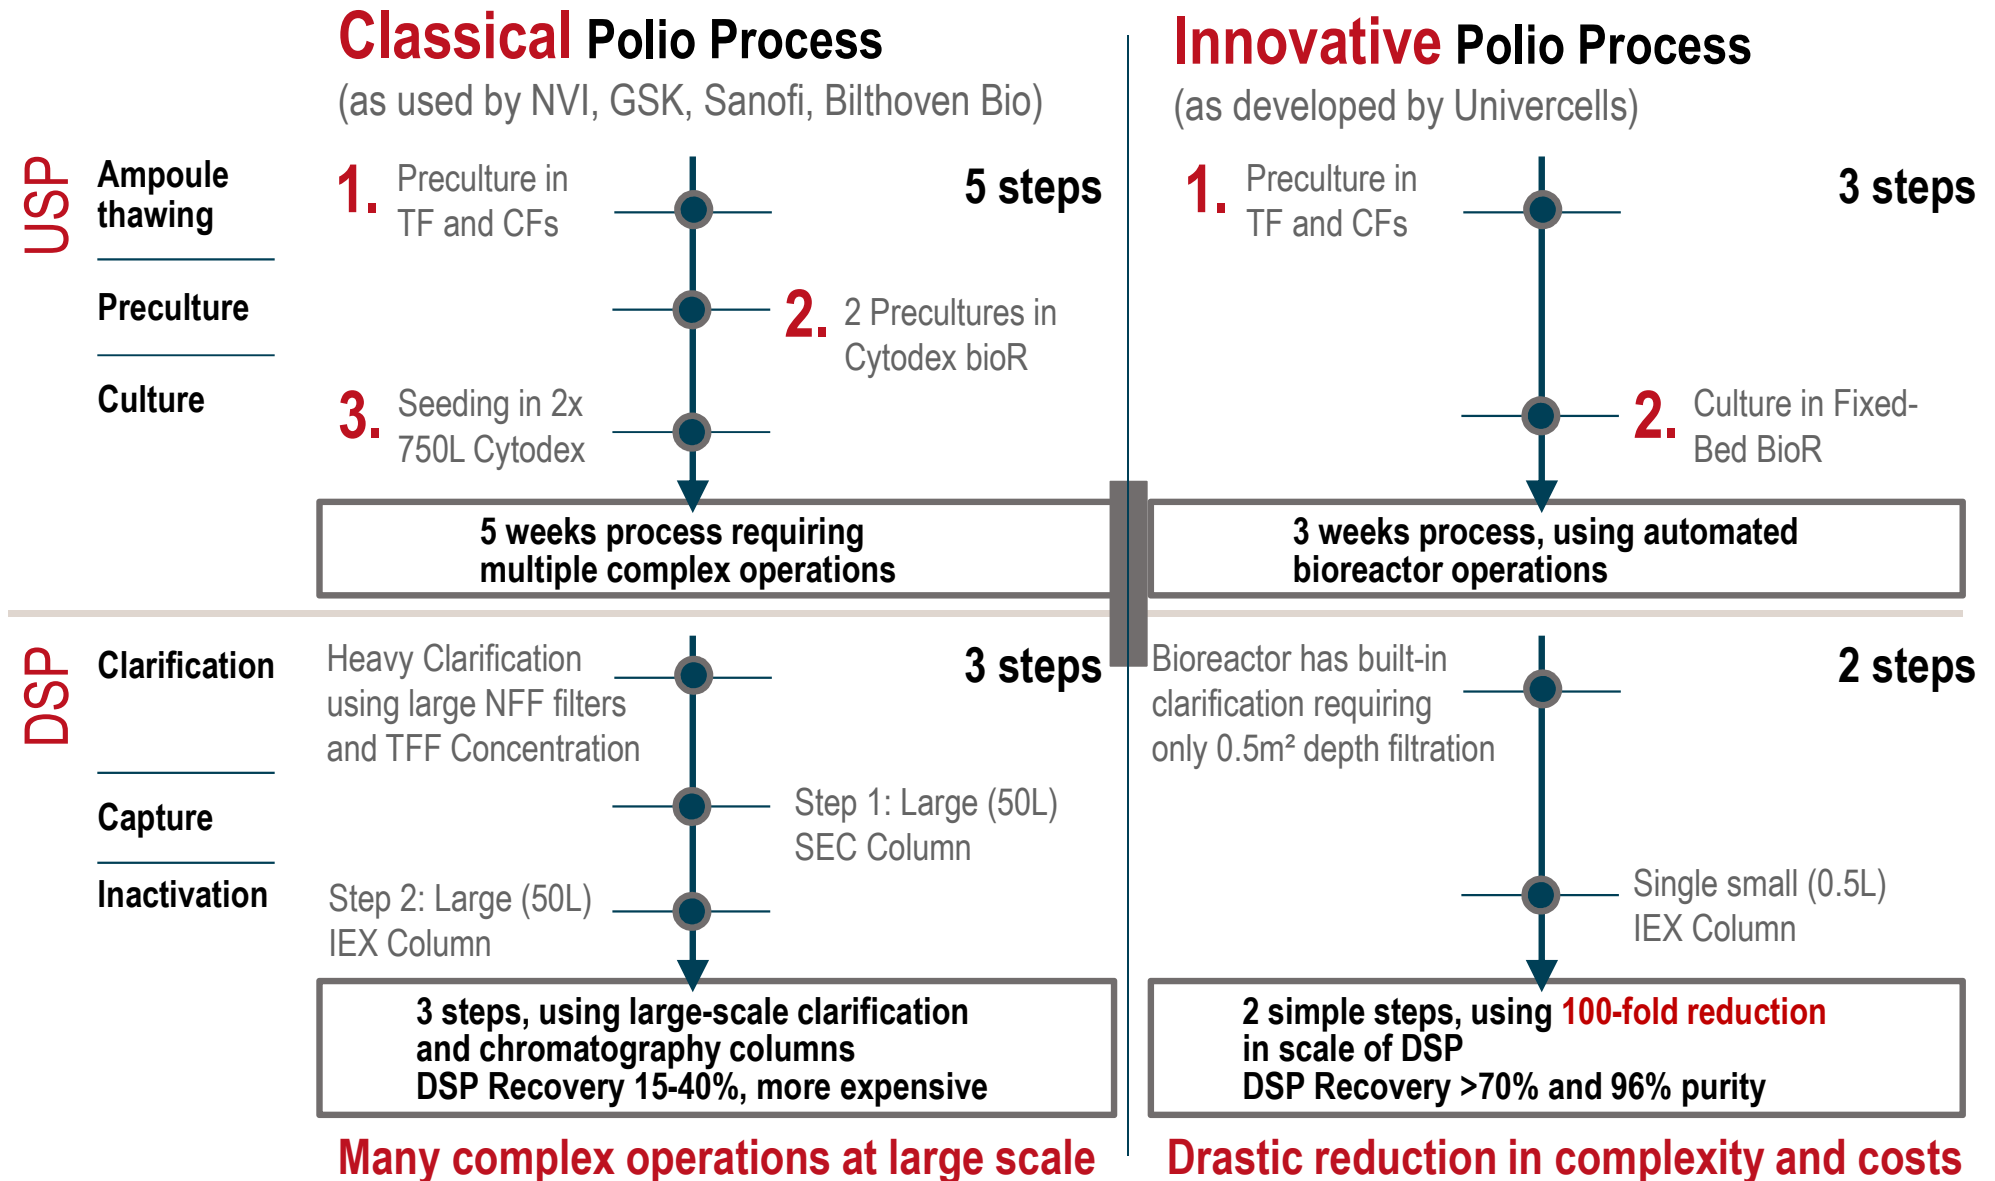

# Impact of the microfacility of the fully-loaded cost of manufacturing

Case study on the manufacturing of a trivalent Sabin Inactivated polio vaccine (sIPV)

# Global Process Comparison (USP and DSP)

# Platform parameters (indicative) – based on Biosolve™ simulations

**Building Footprint** (m<sup>2</sup>): <1000

**CAPEX:** ~€10M

**Doses/Batch** (doses): 1,000,000

**Batch/year:** 40 (2 microfacility skids)

**Doses/year** (M doses): 40

**FTE's** (Management-Logistic-QA): 15

**FTE's** (Technicians-QC): 40

OmniVax vaccine  
manufacturing platform  
should deliver trivalent  
sIPV at a CoG of  
~\$ 0.15 per dose

# Vaccine Manufacturing at Laboratory Scale

- > Facility design ongoing with engineering company
- > Challenge Biosolve estimations:
  - > ~ 1,000 m<sup>2</sup> flexible facility with 2 "Micro-facility" skids
  - > CAPEX < EUR 10M capable of ...
  - > ... delivering 40M doses trivalent IPV vaccine / year

# Summary of platform and concept

## Platform and concept

1

### **Industrial production at lab scale**

> Highly intensified process allows miniaturization of commercial manufacturing

2

### **Delivers Low COGs**

> Step change in manufacturing scale and yields significantly reduces COGs

3

### **Broadly applicable to viral vaccines**

4

### **High Containment and safety**

5

### **Rapid response to global threats**

- > Factory operational in few months
- > Can be implemented in new or existing facilities
- > Plug & Play system: can be rapidly deployed in-country-for country manufacture
